THES ARE CAT I12H3 + APPLIANCES
INTRODUCTION

These instructions describe how to install and use Saunier Duval appliances. It is important to pay attention to the warnings on the packaging and the casing of the appliance, and follow the information given in this document.

These water-heaters are gas-fired appliances providing instant hot water to fill a sink or a bath.

The OPALIA X13 water-heater is of the room-sealed type, that is the venting of combustion products and the incoming fresh air pass through a flue system. This venting principle offers a variety of advantages, such as:
- installation with greatly reduced space requirements and with no need for room ventilation;
- a number of installation configurations depending on the constraints of the premises.

The OPALIA X13 water-heater is of the II 2H3+ gas category for use with either natural gas (G20), butane (G30) or propane (G31)

The water-heater is delivered for a flue system connection with a top outlet to right or left.

Its variable input means that whatever the rate at which water is drawn, there will be instantaneous hot water at a very nearly constant temperature within the maximum capacity of the appliance.

The ignition system on this water-heater with no permanent pilot has been designed to achieve maximum energy saving.
The water-heater is delivered in two separate packages:
- the water-heater
- the flue system

Net weight: 24 kg
Gross weight: 26 kg

Accessories
Various size spouts are available. Please contact your supplier.
TECHNICAL DATA

When determining the siting of the water heater, make sure you keep an approx. distance of 50 mm between the sides of the appliance to ensure total accessibility for servicing.

The jig will enable you to determine the position of the flue system hole at the top outlet. All information regarding the installation of the flue system is provided in the flue system package.

If the water-heater is not fitted straight away, the water and gas fittings must be protected from contaminants E.G. plaster, paint.

PIPE FITTINGS:
- Gas Manual gas cock 3/4" F - 1/2" M
- Cold water inlet : stop cock 3/4" F - 1/2 " M with angled tail
- DHW outlet : 3/4" F - 1/2 " M angled tail

WATER HEATER INSTALLATION

This appliance must be installed in accordance with the current issue of:
- The gas safety (Installation and use) regulations
- The building regulations
- The local water company byelaws
- The building standards regulations (Scotland)
- The health and safety at work act.

The gas safety (installation and use) regulations: it is the law that all gas appliances are installed by competent persons in accordance with the above regulations. Failure to install appliances correctly could lead to prosecution. It is in your own interest, and that of safety, to ensure the law is complied with.

LOCATION

When determining the siting of the water heater, make sure you keep an approx. distance of 50 mm between the sides of the appliance to ensure total accessibility for servicing.

The jig will enable you to determine the position of the flue system hole at the top outlet. All information regarding the installation of the flue system is provided in the flue system package.

If the water-heater is not fitted straight away, the water and gas fittings must be protected from contaminants E.G. plaster, paint.

TECHNICAL DATA

Variable output of 8.7 kW (29665 Btu/h) to 22.7 kW (77403 Btu/h)

Efficiency 78.4%

Minimum flow rate, hot water temperature:
- maxi. position 2.7 l/min (0.60 g/min)
- mini. position 4.2 l/min (0.92 g/min)

Maximum flow rate (by flow limiter) 3 l/min (2.86 g/min)

Specific flow rate (Δt 30 °C) 11 l/min (2.42 g/min)

Minimum water pressure (pw) 0.3 bar (4.50 Ib/in²)

Maximum water pressure* (pw) 10 bar (150 Ib/in²)

Max hot water temperature 60 °C

Venting of flue gases via flue system Ø 60 mm

Incoming fresh air via flue system Ø 100 mm

Supply voltage 230 V

Current 0.31 A

Power 55 W

Electrical protection IP 44

* These maximum water pressure values take into account the dilation of the water.

Gas Category: II2H3+

Natural (G 20) (ref. 15°C and 1013 mbar)
- Ø burner injector 1.20 mm
- Appliance inlet pressure 20 mbar
- Max. gas flow rate output 2.75 m³/h
- Min. gas flow rate 1.13 m³/h

Butane (G 30)
- Ø burner injector 0.80 mm
- Appliance inlet pressure 28 - 30 mbar
- Max. gas flow rate output 2.04 kg/h
- Min. gas flow rate 0.83 kg/h

Propane (G 31)
- Ø burner injector 0.80 mm
- Appliance inlet pressure 37 mbar
- Max. gas flow rate output 2.02 m³/h
- Min. gas flow rate 0.82 m³/h

Only a qualified technician is authorized to intervene on sealed mechanisms.
FLUE CONFIGURATIONS

HORIZONTALE FLUE
Maximum flue index: 60 Pa.
This value is reached when $L$ exceeds 3 m (include elbow).

VERTICAL CONCENTRIC FLUE Ø 80 / 125 mm
Maximum flue index: 60 Pa.
This value is reached when the vertical flue $L$ exceeds 7,5 m (include adapter).

TWIN PIPE FLUE 2 x Ø 80 mm
Maximum flue index: 60 Pa.
This value is reached when $(L_1) + (L_2)$ exceeds 11 m (includes elbows and terminal).

The flue must be fitted with a minimum slope of 35 mm per metre towards the terminal.

Important: remove the flue restrictor ring when $(L)$ exceeds 1 m.

Important: remove the flue restrictor ring when $(L)$ exceeds 4 m.

Important: remove the flue restrictor ring when $(L_1) + (L_2)$ exceeds 8 m.
INSTALLATION

Before installing the water-heater, the water pipework must be flushed out to ensure that there is no foreign matter present that could damage the heater.

NOTE: do not use solvent products.
- Using the template supplied, fasten the hanging bracket onto the wall.
- Hang the water heater onto the hanging bracket.
- Connect the pipework and fittings, supplied, to the gas inlet, cold water inlet and hot water outlet, see diagrams.

ELECTRIC POWER SUPPLY

- Connect the water-heater power supply cable to the 230V mains supply. Ensure that the live and neutral are connected correctly. To comply with current standards, this connector must be made through a double-pole switch with a contact separation of no less than 3 mm.

Warning: the power supply cable built into the water-heater is specific to it. If you wish to replace it, please order a new one quoting part number 59114 from an approved Saunier Duval dealer.
**Commissioning and Lighting**

<thead>
<tr>
<th>Important: before operating the boiler, remove the two fan transit packing pieces</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - ON / OFF button</td>
</tr>
<tr>
<td>2 - hot water temp adjustment</td>
</tr>
<tr>
<td>3 - reset button</td>
</tr>
<tr>
<td>4 - safety indicator</td>
</tr>
</tbody>
</table>

**Start-up**
- Turn the ON / OFF button to **ON**
- Open a draw OFF tap
- Turn the temperature adjustment to obtain the desired temperature

**Stopping the water-heater**
- Turn the ON / OFF button to **OFF**

**Operating principles**
The **OPALIA X13** water-heater operates with no permanent pilot:
- when a hot water tap is opened, the gas entering the burner is ignited by a spark train emitted by the ignition electrode. A second electrode checks for the presence of a flame at the burner, the appliance is shut down by disconnection;
- when the hot water tap is closed, the gas input is cut off by the valve and the appliance is shut down.

**Safety shutdown**
A malfunction or an abnormality gives rise to the disconnection of the appliance, and the safety indicator (4) lights ...............................................
To restart the water-heater, press the RESET button (3) ..............................

**Hot water temperature adjustment**

**Safety Devices**

**Air flow safety device (air pressure switch)**
In the event of even partial blockage of the flue, for whatever reason resulting in a reduced air flow, the water-heater’s built-in safety device comes into operation: the burner is shut down whilst the fan continues to operate. The water-heater is ready to operate as soon as the fault has been rectified.

**In the event of loss of gas supply**
The safety device automatically disconnects the water-heater. When the gas supply is restored, press the "RESET" button (3) ..............................

**Overheat cutout device**
If anything occurs which results in the overheat cutout device shutting down the water-heater, please call your nearest approved after-sales organisation.

**IMPORTANT:** It is forbidden to bypass or tamper with any of the safety devices. If, after attempting to use the heater, a safety shut-down condition occurs, this must be rectified immediately by a qualified, competent person.
SERVICING / MAINTENANCE

To ensure the continued efficient and safe operation of the water-heater, it is recommended that it is checked and serviced annually.

The technical maintenance of the appliance must be carried out by a Saunier Duval approved specialist who will more particularly inspect the heating element, burner, safety mechanisms and servo-systems.

If the appliance is installed in a region where water is very hard and a drop in the water flow rate is noted and/or a noise phenomenon, descaling of the heat exchanger is required.

To carry out this descaling:
- Shut off water supply,
- Open one or various hot water taps to drain the water-heater,
- Dismantle heat exchanger and fill with a 15% inhibited acid solution,
- Leave to act for 10 to 15 minutes then rinse thoroughly,
- If necessary, repeat operation.

The periodic cleaning of the panels of the water-heater can be carried out with a cloth dampened in soapy water. Do not use abrasive or solvent-based chemicals, as they may damage the coating.

DRAINING

If there is a risk of frost it is essential to drain the heater:
- Shut off gas supply
- Shut off water supply
- Open all hot water taps

CHANGING GAS TYPE

If the kind of gas supplying the appliance is changed, certain parts of the burner and pilot need to be modified. These modifications and the new adjustments they involve must only be carried out by a qualified engineer.
